

Snoutboard Podcast Conductor

Internal production notes for a paid 15-minute Patreon research episode.

Generated: 2026-06-10 13:56 UTC

Episode length 15 min Structured as a host conductor, not a word-for-word legal or business script.	Roblox source set 348 Latest non-empty snapshot coverage: 2026-06-09.	Fortnite source set 100 Latest non-empty snapshot coverage: 2026-06-09.
--	--	--

0:00 - 1:00 - Cold open

Role: Hook

Cards/tools: Top 5 Most Played Games, Data Source & Health, Player Activity Landscape

On-air copy:

[Start on the Roblox page. Keep the Top 5 Most Played Games visible.] Today I want to look at the market from the creator's side: not as a promise of what will work, but as a way to ask better questions before building. The biggest captured Roblox signal right now is Brookhaven RP, with 446.1K captured players. The question for this episode is simple: what does today's data suggest creators should study before they commit to a new idea?

Clip potential: Clip A - Market pulse: open with Brookhaven RP at 446.1K captured players, then pivot to "attention is not opportunity."

Producer notes:

[Glance at Data Source & Health before you start reading numbers.]

If you want a quick thesis line, say: Simulation is the genre signal I want to keep testing today.

Say once, early: this is independent creative research, not official platform guidance or a success guarantee.

Reflection prompt: Something to reflect on is the difference between attention and opportunity: a large audience signal shows where players are gathering, but it does not automatically reveal what a new creator should build.

1:00 - 4:00 - Roblox market pulse

Role: Data tour

Cards/tools: Top 5 Most Played Games, Most Played Genre Mix Estimated, Fictional Roblox Experience Archetypes

On-air copy:

[Stay on Roblox. Start with Top 5 Most Played Games, then scroll to Most Played Genre Mix Estimated.] The first pass is the market pulse: where are players visibly concentrated right now? The top captured experiences are 1. Brookhaven RP, with 446.1K players, 2. [] Adopt Me!, with 332.8K players, 3. Blox Fruits, with 245.2K players, 4. RIVALS, with 229.4K players, and 5. 99 Nights in the Forest, with 224.4K players. I do not want to treat this as a list of games to copy. I want to treat it as a list of player promises to study: what is the fantasy, what is the loop, and how quickly does the player understand why they should click?

Clip potential: Good secondary clip if the top-five list has a surprising mix: frame it as 'study the player promise, not the game title.'

Producer notes:

[Scroll down to Most Played Genre Mix Estimated.]

Largest genre signals: Simulation at 36% of tracked players, Roleplay & Avatar Sim at 30% of tracked players, and RPG at 12% of tracked players.

[Scroll down to the Fictional Roblox Experience Archetypes row.]

Reflection prompt: Remember that a median profile is different from an average profile: the median shows a middle example, while the average blends the dataset into a composite that may not exist as a real game.

4:00 - 7:00 - Movement watch

Role: Momentum

Cards/tools: Trending Games, Most Played Games Over Time, Player Activity Landscape

On-air copy:

[Scroll back to Trending Games, then open Most Played Games Over Time.] Now I want to separate size from movement. A game can be huge and slowing down, or smaller and moving quickly. The movement panel gives me three useful prompts today: [NEW CODE!] Trade Clicker for player gain, Ronautica for position gain, and Voler des Robux (SIMULATION) for player loss. I would present these as research leads, not forecasts. The job is to ask why the audience is moving, not to pretend we already know where they will go next.

Clip potential: Strong short-form candidate when there is a clear mover: contrast a large game with a fast-moving game and say, 'size and momentum are not the same signal.'

Producer notes:

Player gain: [NEW CODE!] Trade Clicker (7800%).

Position gain: Ronautica (+78 spots).

Player loss: Voler des Robux (SIMULATION) (-100%).

[Open Player Activity Landscape and switch between Today, 7D, and Month if you want a visual beat.]

Reflection prompt: Something to reflect on is momentum versus durability: a spike can reveal curiosity, but sustained activity is what usually deserves deeper design study.

7:00 - 10:00 - Fortnite creator signals

Role: Metadata read

Cards/tools: Primary Label Usage Over Time, IP / Collaboration Signals, Latest Imported Fortnite Islands

On-air copy:

[Switch to the Fortnite page. Start on Primary Label Usage Over Time.] The Fortnite side needs a different tone. I am not reading this as a popularity chart; I am reading it as metadata, packaging, and positioning. The strongest captured label signal right now is team deathmatch, and that tells me what kind of language or format is showing up repeatedly in the imported island set. [Scroll down to IP / Collaboration Signals.] If an IP or collaboration signal appears, I would treat it as a theme watchlist, not as proof of demand.

Clip potential: Potential Fortnite clip: team deathmatch is a packaging signal to watch, not proof of popularity.

Producer notes:

Most repeated captured labels: team deathmatch (25 islands), deathrun (13 islands), pvp (9 islands), arcade (5 islands), and 1v1 (5 islands).

[Scroll down to Latest Imported Fortnite Islands if you want one concrete example to mention.]

IP and collaboration watch: Star Wars appears across 11 unique islands and Sports IP appears across 1 unique islands.

Reflection prompt: Remember that labels describe how an island is packaged, not necessarily why players stay. A strong label can suggest positioning, but it should be paired with design and retention questions.

10:00 - 12:30 - Creator takeaway

Role: Synthesis

Cards/tools: My Game Idea Is, Game Template Generator, Research Signal / Design Cues / Warnings

On-air copy:

[Scroll down to My Game Idea Is. Then move to the Design Cues card on the right.] This is the practical part of the episode. If I were a creator using this dashboard, I would not ask, 'What should I copy?' I would ask, 'What format is already familiar to players, and what twist could make it feel worth clicking?' For today, Simulation is the biggest genre signal I would keep in mind, but I would use the subgenre and design cues to avoid staying too broad. [Scroll down to the Example Card or suggested games if you want a concrete reference point.]

Clip potential: Clip B - Creator takeaway: Simulation is the strongest genre signal, but the useful lesson is to study subgenre mechanics instead of copying the surface theme.

Producer notes:

If a creator wants to play near demand, start by studying Simulation, then look one level deeper at subgenre mechanics rather than copying the surface theme.

On Fortnite, team deathmatch is the label to watch because it is the most repeated captured primary label.

[Open Game Template Generator only after you have explained the signal. Let it feel like an application of the readout, not the source of truth.]

Reflection prompt: Something to reflect on is that a good creative brief should combine familiar structure with a fresh promise. Familiarity helps players understand the game quickly; novelty gives them a reason to care.

12:30 - 14:00 - Data transparency note

Role: Trust

Cards/tools: Data Source & Health, Glossary, Terms of Service

On-air copy:

[Return briefly to Data Source & Health.] Before wrapping, I want to be clear about the limits. This dashboard is based on stored snapshots and processed fields. Some information comes directly from source responses, and some classification is estimated when the source data is incomplete. That does not make the dashboard useless; it makes it a research tool. The value is in using the signals to ask better questions, then validating before building.

Clip potential: Clip C - Trust beat: explain that the dashboard uses stored snapshots and processed fields, so it is a research tool, not a guarantee of success.

Producer notes:

Latest data quality snapshot available in the app: 2026-06-09T16:35:58.92531+00:00.

[If the Glossary is needed, open it only for one definition. Do not let the show become a product manual.]

Say this plainly: useful signal, not official data advice, and not a guarantee of success.

Reflection prompt: Remember that transparency increases trust: saying what the data can and cannot prove makes the analysis more credible, not weaker.

14:00 - 15:00 - Patreon episode close

Role: Close + clips

Cards/tools: Podcast Conductor, Dashboard Readouts, Clip Candidates

On-air copy:

[Close the dashboard or leave the main readout visible.] This episode is the Patreon product: a guided research walkthrough designed to save creators time and help them think with more structure. I am not selling raw data, and I am not publishing the full analysis outside Patreon. The only public-facing pieces I plan to pull from this episode are three short clips: one market pulse, one creator takeaway, and one data transparency reminder. My closing prompt for members is simple: choose one format, one mechanic, and one visual promise, then research those before you build.

Clip potential: Do not clip this as a standalone ad unless needed. Use it as the internal checklist for selecting the three public excerpts.

Producer notes:

Clip candidate 1: the strongest current Roblox signal.

Clip candidate 2: the difference between median and average.

Clip candidate 3: transparency, limits, and why this is not a guarantee of success.

[Do not frame this as a public podcast with a paid upgrade.]

Reflection prompt: Something to reflect on is the paid product itself: the value is guided interpretation and research discipline, while clips are short excerpts that point people toward the full Patreon episode.

Host reminder: frame everything as independent creative research and interpreted signals, not official platform guidance or guaranteed business advice.
